

What We Are Building

A plain-language guide to the problem, the product and the SIH demonstration

PURPOSE Make every team member understand the same project before anyone begins coding.

ONE TEAM • THREE PAIRS • ONE CONNECTED PROTOTYPE

PAIR 1 Backend (Ruchit and Jeet)	PAIR 2 Frontend (Rudra and Bhagyashree)	PAIR 3 Map and Partner Data (Jaymin and Anjali)
---	--	--

9-page working guide | Read together before implementation

01 | The problem in one picture

Why beneficiaries become confused before they reach the right office

A person may know that they need money for a business or education, but they may not know which government-backed loan scheme fits their situation. They may also approach an office that cannot handle that scheme.

The present problem

Confusion happens before the application can even be processed

Current journey: need → confusion → wrong office → delay

Confusion	What it means in normal language
Which scheme?	The person cannot easily compare project limits, interest and education/business rules.
How much?	The person cannot clearly see the possible loan, own contribution and repayment estimate.
Which partner?	The nearest bank is not automatically the right authorized Channel Partner for that scheme.

OUR JOB Remove these three confusions before the person submits an application.

02 | Our solution in one sentence

What the full team is putting on the plate

THE PRODUCT A simple website that recommends a suitable scheme, shows an estimated repayment and guides the user to suitable Channel Partners.

The journey we will demonstrate

The complete user journey that the prototype must support

The platform gives	Simple meaning
Scheme result	The most suitable option and one possible alternative.
Clear reasons	Why it fits and why another option may not fit.
Money estimate	Possible loan, own contribution and estimated instalment.
Partner route	A map and list of suitable prototype partners.
Final summary	One screen or printable page carrying the full result.

IMPORTANT The prototype guides the applicant. It does not approve, reject or disburse a real loan.

03 | A complete example

Use this same story when discussing the project as a team

EXAMPLE PERSON A Scheduled Caste beneficiary in Rajkot wants to start a dairy activity costing ₹3.80 lakh. Annual family income is ₹3.00 lakh.

What the person enters	What the platform returns
SC certificate: available	Basic eligibility: passes the prototype check
Purpose: business	Recommended option: Term Loan
Project cost: ₹3.80 lakh	Indicative loan: up to ₹3.42 lakh (90% subject to cap)
Income: ₹3.00 lakh	Own contribution shown: about ₹38,000
Location: Rajkot, Gujarat	Suitable partner cards and map markers

The result page also says why Term Loan fits this project size and why Micro Finance does not. Udyam Nidhi may be shown as an alternative when its configured rules match.

WHAT THE JUDGE UNDERSTANDS The team is not merely showing loan information. It is turning a confusing search into one connected decision journey.

What happens next

1. The person reviews the estimated repayment.
2. The platform shows suitable partners for the selected scheme.
3. The person carries the final summary to the chosen Channel Partner.

04 | The five screens

Exactly what should appear in the final demonstration

Front-to-back screen order

Screen	What the user does	What must be visible
1. Home	Chooses language and starts	One clear explanation and a Start button
2. Tell us your need	Enters income, purpose, cost and location	Short form with simple labels
3. Result	Reads scheme and repayment	Recommended scheme, reason, alternative and estimate
4. Partners	Chooses a suitable office	Map, ranked list, address and reason
5. Summary	Reviews the full answer	Profile, scheme, amount, partner and disclaimer

KEEP IT SIMPLE Charts and heat maps are not required for the beneficiary journey. Add them only later if the main five-screen flow already works.

05 | Three parts working together

The product is complete only when all three answers reach the same result screen

How the three pairs connect

Simple team-to-product connection

Part	Question answered	Example output
Scheme guide	Which option fits this person?	Term Loan fits because the business cost is above the micro limit.
Money guide	What may the person need to repay?	Possible loan, own contribution and estimated instalment.
Partner guide	Where should the person go?	Three suitable partners, their locations and why they appear.

Pair 1 prepares the scheme and money answers. Pair 3 prepares the partner and map answer. Pair 2 places everything into a clear journey that the beneficiary and judge can understand.

SHARED RESULT The frontend should not show three disconnected tools. It should show one result created from all three parts.

06 | Our USP: No Wrong Door

The simple difference that should remain in the judge's mind

USP The user receives the right scheme, a clear reason and a suitable partner in one journey instead of searching separately.

Normal information portal	Our prototype
Lists many schemes	Asks a few questions and recommends one suitable scheme
Shows interest rates	Shows possible loan, own contribution and an estimate
Shows nearby banks	Filters partners that match the scheme and prototype status
Ends with information	Ends with one clear application-ready summary

The wow moment in the demo

1. Enter the Rajkot dairy example.
2. Show the recommendation with 'Why this?' and 'Why not Micro Finance?'.
3. Show the estimated amount and own contribution.
4. Open the map and show only suitable prototype partners.
5. Finish with the complete summary instead of ending on the map.

WINNING MESSAGE We prevent the user from choosing the wrong scheme and approaching the wrong channel.

07 | How the three pairs contribute

High-level work split with an example for the two people inside every pair

Pair	Main responsibility	Person A example	Person B example
Pair 1 Backend	Turn user details into scheme and money answers	Prepare scheme rules and test examples	Build the calculation and connect the answers
Pair 2 Frontend	Create the five-screen user journey	Build Home and input form	Build result, partner display and summary
Pair 3 Map and Partner Data	Prepare partner information and map behaviour	Collect/clean partners and coordinates	Build markers, distance and filtering

PARALLEL START Pair 2 uses sample answers while Pair 1 builds the real answers. Pair 3 uses sample user locations while preparing the partner module.

What each pair hands over

- Pair 1 gives Pair 2 fixed response data for scheme and calculation results.
- Pair 2 gives Pair 1 the exact user fields and the result fields needed on each screen.
- Pair 3 gives Pair 1 cleaned partner data and gives Pair 2 a map component/result format.

08 | What we will present at internal SIH

A focused three-minute prototype, not a promise of a complete government system

Three-minute demonstration

1. Explain the present confusion in 20 seconds.
2. Enter the example beneficiary profile.
3. Show the scheme, reason, alternative and repayment estimate.
4. Show the partner map and ranked partner cards.
5. Show the final summary and explain the No Wrong Door USP.
6. Close with limitations and the production connection needed later.

We will confidently show	We will not falsely claim
Working rule-based recommendation	Automatic government loan approval
Indicative repayment calculation	Final bank repayment schedule
Official partner identities/addresses where available	Live fund/NPA data without an official connection
Prototype filtering and routing	Direct application submission to NSFDC

DEFINITION OF SUCCESS Every team member can explain the same user journey, and the complete prototype runs from first input to final summary.
